By the new organizational solution in functioning universities, the degree of using data and information at faculties is reduced and transferred to universities through mutual functions.

To realize the missions of universities under new study conditions, the advancing of their internal and external communications is of a crucial importance. The external communication is done, before all, through the exchange of information and other forms of cooperation with the state authorities, home and foreign universities within the framework of initiatives in the field of advanced schools, while the internal communication is done between the members of universities.

The common integrative functions of universities mean the approach to all the information connected to the activities of their members (teaching, scientific, artistic and educational activities, entrance requirements, financial flows, international cooperation, and so on). To realize this concept, it was necessary to accomplish considerable connectivity and unity of the university information system.

This work points to the transitional phase of the solution with the task to overcome problems in functioning universities until the moment of introducing the new uniform information system.
